

# Meet Athena Software

(Music)

**Greg Stanley-Horn:** Back in 2001 I was actually working in social services and part of my job was to find some case management software that was suitable for a nonprofit. So, I looked around in a pretty exhaustive search, and there just wasn't anything out there that really spoke to who we were as an organization and that would help us record the kind of information that we did in a way that accurately and realistically reflected our services and that would help us be more effective and achieve better outcomes for our clients.

So, after finding that there was nothing really out there I spoke with my brother, and my wife and we started Athena Software. And then we built an application that had all the things we thought case management software should have. And we called it Penelope.

Since we released the first version of the software 13 years ago we've gone from this... (image 0:47) to this... (image 0:48). Over the last 14 years, Athena has experienced exciting growth into global industry leaders. Our client base has grown from relatively small organizations to diverse networks of organizations anywhere around the world.

Penelope is a fully featured, comprehensive case management application that handles all aspects of an organization. Penelope has always been able to keep track of your scheduling and your notes. But now it is also a communication centre and a workflow hub. I think what makes Penelope unique and different is that it brings together all the strands of an organization's operations and it brings it into one easy-to-use and simple framework.

We're passionate about our software and we're passionate about our client's success. It drives us to continuously improve it as well as improve our client support and our professional services. We've got a world class support and deployment team and our commitment to constantly improving Penelope and our strong emphasis on security means you are in safe hands. We believe technology should make your life easier, not harder.

In a simple, smart, connected way, with your vision and our technology, we'll get there together.
